Thanks for the reply db,

I couldn't find any resolution to the matter on any of the pages returned from your search results, nor anything I searched for myself. The best suggestion I have found, which unfortunately did not help in the matter, was from one of MS's KB articles. They suggested assigning a drive letter to the volume, applying desired permissions and then remounting it. This had no effect, even after completely removing the existing permissions and then redefine them. From my research so far it appears this is a bug (feature :) in all flavors of NT but I cannot find a solution yet. Any other ideas?

Thanks,

Greg

that's a good question but
never had an issue with this.

i provided a link that may be
of some help:

<http://search.microsoft.com/results.aspx?mkt=en-US&form=MSHOME&setlang=en-US&q=permissions+on+a+mounted+volume&x=9&y=13>

give us an update with
your resolution....

Hello,

I've come across an odd permissions issue with a mounted volume and am

Re: permissions issue on mounted volume...

Re: permissions issue on mounted volume...

hoping someone can shed some light as to what is going on. I have a partition created on my computer that I have full control over and I am not experiencing any permissions issues on it. This partition is accessed using a drive letter (O:). I have another partition, on another hard drive, and have mounted it to a folder on the O: drive (both formatted with NTFS and both have the default permissions applied, ie I have not customized them in anyway). For some reason I am unable to delete folders on this mounted volume but files do not seem to be affected. I can move and rename these folders without any problem (even to a different partition) but when trying to delete I get an access denied error. I was first thinking that maybe the folders are in use (locked) but even after a reboot they are undeleteable; the Administrator account has the same problem. The permissions
