Hello Everybody,

I have WinXP SP2. After running a new anti-spyware, all limited accounts are giving errors on start-up, all of them refer to same memory address i.e. 0xc0000022. The application which try to start and end up giving aforementioned error are ccApp.exe, reader_sl.exe, osCheck.exe and others I cannot remember. I have googled it extensively. I have found that it is because some "3rd party" software has changed the default permissions but there is no information available how to fix this problem. Any help in this regard will highly be appreciated.

Thank you,

Syed Zeeshan Haider
