I don't have to enter a password, it just comes to the screen where i just click on my name (box) and it goes to the desktop. No passwords involved.

thanks

For some reason my computer now boots to the user login in screen, where as before, it booted right to the desktop. Can anyone tell me how to get back to booting to the desktop and stop booting to the user login screen?

thanks

1. Click Start / Run / control userpasswords2 {Enter}
2. Tick the box that requires users to enter a password.
3. Click on your own account name.
4. Untick the box that requires the users to enter a password.
5. Click OK.
6. Enter your current password when prompted.
