I used to know how to rotate the screen but had forgotten, so this is an interesting thread...

But ctrl alt and arrow don't do anything as far as I can tell, on either my pc or laptop, both of which have Intel chipsets. What else do I need to know?

Cheers,

S

Thanks Ace. Worked perfectly. I am in your debt.

For Intel-based chipsets, Ctrl+Alt+arrow keys changes screen orientation. You have to be logged into the computer to use the combination, they will not work from the login screen. Turning the screen over is a frequent prank played by students and even some employees at a college I work for.
