I am running XP Pro and use Acronis for backup. I am trying to Explore a backup archive in Acronis and I get the following error message – "Cannot assign a drive letter to a partition from the backup archive." When I review the System Log file I find a warning message from source Ftdisk – The system failed to flush data to the transaction log. Corruption may occur. A further explanation says "NTFS could not write data to the transaction log. This could affect the ability of NTFS to stop or roll back the operations for which the transaction data could not be written. NTFS could not write data because of one or more of the following reasons:

1.. I/O requests issued by the file system to the disk subsystem might not have been completed successfully."

I am rather sure this is an issue with XP because I can open the same archive from a different machine. I installed a newer version of Acronis and have the same problem. Any suggestions will be greatly appreciated.
