Does this command (in Start/Run) work?

```
msinfo32 /msinfo_file="C:\System Information Report\System Information Report.nfo"
```

Assumes that the .nfo file is present in the following location:

```
"C:\System Information Report\System Information Report.nfo"
```

I have a problem opening NFO files when they are stored in folders that have spaces in the name. For Example: Opening directly from C:\ runs fine but if I place the file in C:\Documents and Settings\, I get the error that the file cannot open or is corrupt. I have searched everywhere for an answer to this problem but have not found anything helpful yet. Anyone else having this problem? If not, try it and see what happens. Run the tool and then save the file to a folder that has spaces and see what happens. Any help on this would be nice.
