Gerry,
True. And if problem shows up in the security log, you see "Failure audit"

karl

"Error" not "Failure" Karl.

Hope this helps.

Scott,

Double-click on one of the event log names listed in the left pane of event viewer. Review the log, looking for events marked as "failure" or "warning".

RtClick on an "interesting" event. Select Properties from the context menu. You will receive a brief explanation of the event. At the end of the explanation will be a link which will give you still more info regarding the event.

Incidentally, the link is:

<http://go.microsoft.com/fwlink/events.asp>.

Karl,

Thanks for your advice. What should I look for in event log?
In
addition, I notice that when I use internet to surf the website
and
auto shut off has higher frequency.

Scott

æα¼¶¼g...

Scott,
Examine the event log.
Win+R || type EventVwr.msc || hit Enter

My notebook computer
suddenly shuts off
automatically. The
intervals are irregular, i.e. 5
mins to 1 hr. It does not
seem to
be power off as when I turn
on the computer again, there
was no
question asking if boot-up
executes normally. What
should I check
before I send for repair? I
have no idea if it is caused
by
software or hardware.
Thanks,
