Hi Bob, You're most welcome and I'm so pleased this thread was of help to you.
Been busy but just tonight I again Disabled my RTHDCPL.EXE from Startup and found that I DO still have Sound. I guess we're merely stopping it from starting up as we go into Windows but we're NOT stopping it from being used when we play an MP3.
So far, this appears to me to be the solution and will remain so until someone tells me or I discover, I'm preventing the file from some action I'm presently unaware of. If you've discovered some unfavourable occurrences pls let me know.

I emailed Real Communications for the second time a day or so ago but so far again they've chosen not to reply. I'm not too impressed.
My Realtek Sound is built into my MB, not a Realtek Sound Card. Is yours too?

I have no idea what the guts consist of. Ours are Dell's and I have not looked into what it's internal components are.

I just checked and all the languages returned to the temp folder so the fix was temporary. I've lost interest at least temporarily, since it's not terribly important.

Just looking for similarities.

Re: Multiple Language Bin Files in Temp Folder

I do suspect though that some Install activated these language files to appear as it was six months after I had my computer assembled that I noticed these language bin files in the Temp folder. I rather think I would have noticed them immediately but ... I'll likely never know for sure. Regards

My wife got her computer just before Christmas and I got mine about two weeks later. I just checked my drive copy in Catfish, dated 18 Jan, and the language files were there then. The language files were dated 8 Jan, so that's about the date I got it.

Hi Bob, I think I'm posting in the wrong spot but I wanted to follow your response and I think I got confused. Nevertheless this will likely be the last Post or we'll be barred for making this thread so long.

Thx for the info that we've had these beasties since inception.

My Temp folder is still clean throughout approx 24 hrs and a few Shut Downs and Reboots. Check to see if your RTHDCPL.EXE hasn't reverted back into Startup.

Mine reverted itself the first time I removed it from Startup. It's stationary for now.

I use a great (now defunct) program in Quick Launch, "Startup Manager" by Brad Stowers 727KB. Real handy. You can get it on:
<http://f2.org/archive/software/startupmgr.html>

My firend sent me AUTORUNS.ZIP 533 KB. Google to find it. I haven't tried it.

I agree this problem is History now that we have a way, although not 100% desirable, to derail the bin files from loading. It's not the HD space, I have lots for another lifetime, it's the annoyance knowing and seeing those useless files sitting there due to sloppy programming by Real Communications when they know the problem exists. I'll favour Creative for Sound the next time I get a Computer.

GL with your Dell. I bet they've solved this glitch. Regards ...

RealTek icon but I too am rid of those returning language files.

BoB

I spoke too soon. They returned here too, however, I turned my pc totally off last night and when it booted this morning, they were gone. A complete power down seemed to do the trick vs a reboot. Good luck!
