Richard: Sorry I didn't get back to you with feedback sooner. The last month was kind of wild so I have just gotten around to following up on this problem. Here is where it stands now:

The applet on <http://www.anfyteam.com> worked fine with the IE7 but I still get the little red X's on the Yahoo game site. I followed your instructions to check my settings on ie against the link you gave me, and after making sure all my settings were consistant with yours, it will would not work. I had installed Firefox some time ago but had not gotten around to checking it out, so I tried it. No Problem opening the Yahoo games with Firefox browser.

I use Office Outlook, not OE so I did not go through those procedures.

I'm a little unclear about part of your instructions to go to my Java through control panel. You said: "Then delete the TIF and open IE and go here:". What TIF am I supposed to delete?

Also, since my last posting about this problem, iWin downloaded and installed a new game manager update, and now I am getting the little red x's in the game listing. I also keep getting messages about script errors and a message that I need to download and install Macromedia Flash Player (which I was pretty sure I already had), but when I click on the supplied link, I get a message that "one or more ActiveX controls could not be displayed, then another script error, but I did get the download page for the Adobe Flash Player and I was not able to get it downloaded correctly. I am going to try again while I wait to hear back from you. I really appreciate your help with this. It is driving me crazy.

You're very welcome. I went to yahoo.com > games > card > Addiction Solitaire and it displayed correctly and the java game worked fine for me with Sun JRE only installed. Does the applet on this page: <http://www.anfyteam.com> work okay for you? If not, does it work for you in firefox (if you have firefox)?

Re: Java Question

It sounds like your default medium security and privacy settings should be okay. You could compare them against these:

http://richard-and-michaela.com?xp_ie7_oe6_settings

Also, you may want to try this with the browser windows closed:

Go to 'Control Panel' > 'Java(TM) Control Panel' > 'Advanced' tab > 'Default Java for browsers' section and uncheck 'Microsoft Internet Explorer', apply the change and close the Java Control Panel. Then delete the TIF and open IE and go here: <http://www.anfyteam.com> Of course the applet won't be working. Next, close IE, delete the TIF and go back to the Java Control Panel and check 'Microsoft Internet Explorer' apply the change, etc. Then open IE again and go back to the anfy webpage and hopefully the applet will work fine and all applets will work fine in IE with Sun JRE only installed. I ran into this problem some time ago (running IE6, not IE7) with the red-x showing instead of the applet image and I finally stumbled into the above through trial and error to fix it.

Richard: Thanks for your help. I was able to successfully delete all of the previous versions of Java that was on my Add/remove program list and I successfully downloaded the newest updated version of Java – BUT:– I am still getting the little red X's instead of pictures. Example: Yahoo has an online card game that I used to play by the name of "Addiction". It is a Gamehouse game. Now when I go to Yahoo>games>card>Addiction>play now: All I get is a big blank page with the little red x in it. I am running Windows Live One Care Antivirus, firewall etc. suite and have my internet options settings set for default medium security and privacy. Is there a setting in these internet options settings that could be causing these little red x's?

"Richard Eagle" wrote:

Magsmom, you cannot view applets in either OE or Windows Mail unless you have MS JVM installed. Support for MS JVM ended Dec 31, 2007 and I would definitely NOT install it. See this link: <http://www.microsoft.com/mscorp/java/default.mspix>

If you have MS JVM and want to uninstall it, I've found this website to be useful: <http://www.mvps.org/marksexp/WindowsXP/java.php>
The manual uninstall method should work okay for you.

Re: Java Question

You should be able to view applets in any webpage if you have Sun JRE (Java Runtime Environment) installed. You can install it from here:
<http://www.java.com/en/download/index.jsp>

I would first uninstall any older versions of Sun JRE in add/remove programs before installing the newer version of Sun JRE.

Hope this helps.

Richard

Don't know where to start looking for answers so I am starting here. I have recently been having a lot of problems with getting those nasty little red "x"s instead of pictures or graphics in e mails or in online games etc. One game site support page article indicated it might be a problem with my Java Runtime program and suggested I might not have the latest version. In checking my computer, I find that I do have program files for Java listed but they don't seem to be working. When I go to my Control Panel and double click on the Java Icon, it tells me that I am missing a registry key. I know I should probably be looking for answers on the Java website, but honestly, even though I am considered to be more than a novice with computers, they are way over my head. Can someone give me some simple and easy to follow advice in this matter? I am running XP, SP2 with IE 7.0
