If you want a clean installation of XP, you won't get it this way.

Image software: Google lists many, of course, Acronis and freeware. Maybe one of my old removed Norton progs offers image, but many users wouldn't recommend Symantec nowadays. What freeware Image software would be a good bet? TIA,

| Create restore point before reformat, after removing previous points, save
| the files to another drive, then reformat? Would the system accept the
| saved
| restore point when copied to the new C:\? Thus, reinstalling apps would
| be
| unnecessary. Is this procedure workable? TIA, any comments.
