Thanks Dave,

I tried Memtest and it said total RAM was 1024
Cache 1 8K ?
Cache 2 512m ?

Anyway, Crucial.com says 1 512 stick, and at startup and windows system properties shows 1 gig.
But windows system info shows total physical memory 512.00MB using start-run-(msinfo32)

I am confused....

thanks again for the reply, 768 was fine and it showed I had 768
This shows I have 512, and i know I have 1 gig there.
It does seem slower than the 768 I had, so I basically need to know
what is
going on. How much ram do I have in there and why is only half
showing up ?

Either one of your modules isn't seated properly or is defective. My
guess is that it's the latter, considering your description of the
seller. If you want to test the module, use something like Memtest86+ or
the Windows Memory Diagnostic:

<http://www.memtest.org/>

<http://oca.microsoft.com/en/windiag.asp>
