Hi, experts!

How to save all Username and Passwords for some internet sites where I need Username and password for access to those all pages. I have different Usernames and Passwords and clean tool for computer each time remove all of them.

I must put this Username and Passwords each 3 or 4 days again for access those pages.

Is any program to save this Username and Passwords to USB Memory Stick and running program return back on their's places.

vouk.adolf@xxxxxxxx

I like to use the Freeware program called "Password Safe". It works just fine from a USB memory stick as well as from my hard drive. I use it mostly on my hard drive but keep a backup copy of the folder on my USB memory stick as well. That way I have a backup and I can use it on any computer I happen to be using at the time, like using one of the library's machines.

You can read about the program and download it at using this link:
<http://passwordsafe.sourceforge.net/index.shtml>

Like any program it takes a little getting used to but I like the way it lets you customize the "Autotype" function if needed. I use the default "Autotype" function for 99% of the places needing a username and password but I did have one bank that needed a custom login/password sequence before it would work. They wanted the Username, a carriage return, wait 3 seconds and then a second carriage return (acknowledging some policy they wanted everyone to read on every login), and then the password, and a final carriage return.

Re: Usernames and passwords

Anyway it's worth looking into, especially if you don't want to deal with purchasing software or using something that has limitations imposed on it unless you purchase a license.
