You said you have standby set to never. I suggest you reset your settings and use the mouse or keyboard to bring it out of standby. Do not use power on switch. Set both mouse and keyboard to 'allow this device to bring computer out of standby'.

Set standby after x minutes. You should turn off monitor and hard drives.

I use Standby all the time through out the day and over night. Then I hit the powerbutton and the computer is on in a matter of seconds with the programs I was using on the monitor ready to go.

Just recently, I haven't installed anything or done anything new – changed no settings, – the computer comes on when I hit the powerbutton but the monitor never does.

In the Power Options Properties I have: Turn off monitors, Turn off hard disks and System Standby all set to Never.

And it's always been like that. Including up to yesterday when the Standby always turned on the monitor.

Any ideas where I could start to get this fixed?

I did go here: <http://oncare.live.com/site/en-us/default.htm> to have Live Care scan my computer and they came up empty handed.

Thanks for any suggestions.

J
