Have a machine running XP Pro and it has had issues for some time. This is an AMD based machine that my wife mostly uses. Isn't overly loaded as far as software is concerned and does have all recent patches and no viruses to speak of.

Anyhow, quite often, this machine will look up or will simply reboot on its own. This happens whether there is a user at the station or not. Just random! Kind of strange behavior and I am trying to figure out what is causing it. Was thinking of just reloading the OS or doing a repair, but beforeso, I started to wonder if it was beyond that and maybe a hardware issue causing it? Could it be? Could this be a sign of a faulty power supply? I have had power supplies act up before, but not necessarily in this fashion. What are your thoughts on that? Any thoughts on what to check? Would hate to reload or repair just ot have the behavior continue. Any thoughts to the best fix to this?

Thanks much for any and all help you all can give me. Hope I can get it figured.

Heat can sometimes cause this symptom. Check the fans?
