ok there are three problems on my computer at the minute:

- 1.my dvd-rom drive is being doubled
- 2.computer crashes randomly with a repetitive sound being played via speakers
3. some "other devices" have no drivers

Now to explain that in more detail:

1.dvd rom drive is being doubled on the my computer screen and in the drivers section of system it is saying that i have two dvd rom drives one in location 0 which is the actual drive and then another which is in Bus Number 0, Target ID 0, LUN 0 which means nothing to me. any idea of how to solve this doubling issue?

2.computer will crash randomly ie while palying games or watching a dvd with a sound being played over and over again on the speakers till i switch ym pc off this suggests a sound card problem but ive updated the card with the latest drivers. and in the device manager there is only one sound driver that is in conflict and thats the "Standard Game port" which is "on CMI8738/C3DX PCI Audio Device" and is using the resources "I/O range 0201-0201" which doesnt make sense can anyone help em with this?

3. other devices in the device manager have no drivers after looking for them using the plug and play method they dont appear on the system. They are called "Ethernet Controller" and "SM Bus Controller" of whihc i dont know what they do or are meant for can anyone help me reenable them?

Tim
