Hello, I need to format again I think, because as usual windows develops a bad case of being ABSOLUTELY JUNK after a few months. This is a known fact, and MANY people get this problem. My problem is that I cannot back up my stuff at the moment, which obviously hampers formatting my drive.

I need to format, as i mentioned before, because Windows is bad in causing random keyboard and mouse freezes (funny huh! whats worse is that the devices are MADE by Microsoft lol haha). Added to that, I dialup to the internet, and try and write here to tell you about these problems, and YOUR OWN SP2 popup blocker kills YOUR OWN PAGE hahahahahahahaha.

Well, is there any way I can destroy Window's bad habits with the keyboard and mouse? Or am I to move to Linux, which is coded MUCH better than Microshaft could ever hope to do.
