Hi... I recently ordered a new case, motherboard, and processor...

I originally purchased my computer with Compaq, and it came with WinXP Home Edition on the harddrive... The harddrive died a while back and I switched it with a new one, but the same OS and product key registered...

When the computer would not boot up on my new setup I tried the "quick restore disks" No luck, then I tried the "Restore disk" No Luck... Then I tried a Win98 boot disk and used fdisk /mbr, no luck.... Then I got a hold of a copy of WinXP install disk from a friend, as my Compaq computer never came with one...

I tried that, no luck.. It doesn't even seem to read it... It goes right to the boot options menu as if there was a problem on the last boot, (safe mode, safemode w/ commandprompt... etc.)

When I choose one, I tried them all... I get...

"STOP: 0x0000007B (0xF894D640, 0xC0000034, 0x00000000, 0x00000000)"

When I researched the error I got

<http://support.microsoft.com/default.aspx?scid=kb:en-us:Q316401>

As I said, it did not recognize the install disk, so then I tried the boot floppies, I think it was a set of 6... I went through the whole process and everything... When It said to insert the WinXP install disk, I did and it just blinked everytime I pressed Enter... I waited a few minutes but nothing happened... I tried the cd that the motherboard came w/ ... that didn't work either... I tried using a more standard cd-rom drive, still no luck...

I have a maxtor DiamondMax 60GB ATA/133 harddrive... Also, the bios recognize the harddrive as the one I mentioned above...

Also, When I put the drive back into my old computer (I gave it to my mother b/c it was better than her old 650mhz duron) The drive boots up fine... I assume the problem is because my chipsets different...

"STOP 0x0000007B" Boot Problem, Tried EVERYTHING

Specs

MSI K7N2GM-V, NVIDIA nForce2 IGP 64 + MCP2SL Chipset
AMD AthlonXP 3200+ Barton
and again the harddrive is Maxtor DiamonMax Plus 60GB

Thanks In Advance...
