Hi all,

I have a P.C. that keeps blowing power supply's.

It is P4 2.4, Gigabyte GA-8IG100MK Main Board in a "whitebox" of unknown make.

Low spec AGP video card

2 x Optical drives

1 x 80gig Seagate Barracuda

The last power supply it blew was a Unicase 400W Silent power supply.

I has been plugged into a middle of the road surge protector the whole time (which seems to fine.)

This has all happened in the same house; however there hasn't been any other power problems.

I'm thinking maybe it's the case because the problems happend when the unit is being switched o every time.

Anyone else seen something like this?

TIA

Rob
