PIO mode is slow, and with a DVD-RW that will significantly impact its ability to burn a disc without a buffer under run. You must find out why it is not being recognized properly; either the cable is bad, the jumpers are set wrong, or there is a problem with the power connector. Did you check the cable and jumpers as per my previous post?

If it is a DVD burner, ***DO NOT*** set it to PIO mode. Please be so kind as to show this to your friend so that he won't suggest it to someone else in the future.

Post back and let us know how it goes.
