It doesn't matter whether you have it master or slave if everything is working. What matters is which drive you have Windows installed on and which drive is your C drive. There are several things you can do.

1) Create your own separate user account, make it password protected, and then install all programs and save all your documents on your separate drive that you have assigned a drive letter by using Computer Management under Administrative Tools.

2) Post here under another thread or go to Google.com and type in how to dual boot with XP (if you are using XP). You obviously have an OS on one drive working, so leave that one alone. What you will want to do is set up the second drive as its own partition and install another OS on it. Then when you boot up, you will get to choose which OS (drive) you want to boot. If you are worried about your dad seeing your drive's contents, then you need to learn how to secure your drive and its access with a password.
