pro supports dual processors/ dual cores, home supports only Dual core as it sees it as one single processor, if it came installed as dual core then it's working, if you installed the cpu then to see the dual core you need to do a repair install to load the drivers for the 2nd core, home will see the second core if you do the repair install.

DO NOT do this if it came already dual core installed with the operating system.

thanks antioch, I guess I'll just sit & wait for Windows Vista to arrive. 'Cause now my PC is up and running smoothly except for the dual core thing...

thank you very much fo your help, really appreciate it.

greetz, Mr.Mystic

hi, I just bought a new pc
with an AMD Athlon 64 X2
4600+ cpu. But
windows
recognises it as a AMD
Hammer Family processor.
I'm not sure if both
cores
are working... is there any
solution to let windows
know that there
is
a
Dual
Core cpu installed?

greetz

What is your OS?
Antioch

Then as far as I know, you would need to have XP PRO 64 bit loaded.
Otherwise, I think your system will only run as 32bit.
I have not looked into this though, since this time last year when MS
launched the 64 bit OS, and that then was my understanding. Technology
changes so quickly.
Didn't the retailer give you any info about this?
Rgds
