I have MSI 845G Max motherboard. I have flashed the bios but that's all I know about bios and I have explicit instructions to do that.

Also one other thing that might help you with helping me is: I have a Wacom on one of the USB ports and it doesn't cause any problems booting in. I bet it turns itself in in a later order, huh?

I'm hoping this information will help!!

Okay, pass along all the instructions!!! I'm good at following directions..

Can you give me directions where to look for the boot order or any other information that's needed, please?

With some BIOSs there is a seperate entry to enable booting from a USB device. This is different from setting the boot order. What motherboard do you have?

I don't believe that is the case. I believe my Bios are set to boot off of the C drive only but I will check.

Any other suggestions, since I don't think the Bios setting is set on

Re: Booting in with USB devices attached and turned on

that?

Look in the BIOS settings for your computer for an item that says something like "Boot from USB device". Make sure it is disabled. It is different for different motherboards so you'll have to see exactly what options are available in your BIOS.

I've had a problem with USB devices in the past but found a work-around but now it's causing more problems.

1st problem was that I got a scanner (USB) and when the scanner was on, the computer would not boot in. Easy solution, turn off scanner and then boot in and then turn on scanner.

Now I've gotten a USB hub and it's doing the same thing. It won't boot in until I disconnect and turn it off and boot in without it.

What a pain!!! Is there any solution for this?
I have Windows XP
Pro, SP2,
Ram is 1 gigabyte, 2.0ghz, Pentium 4.

Anything I can check or do to resolved this issue?
