Hi Guys and Gals
Just built myself a new pc , and have a problem.
Here is what i built.
Asus Motherboard=P5LD2 Deluxe
PCI Express Video Card = ATI Express X1300 Pro , 256MGB
CPU = Pentium D = 3.2GHZ , 800mhz fsb , 2x2 mb L2 cache
Memory = 2 gig , PC2 5300 (DDR2)

When i boot the pc all seams to work acording to the led lites, but no monitor.
PC does not turn on the monitor , I know the monitor works , i unhooked it and put it back on my other pc and it fired right up.
Is this a video card problem or could it be motherboard , or something else? When i started it the first time i heard some beeps but didn't catch how many or anything.
On reboots there are no beeps at all.
Just looking on advise where to start looking.
Thanks

Got a good power supply in there? Does that video card require a separate connection to the power supply? If yes, did you remember to connect it?
