Just to clarify, the response was posted on the original thread but it was not responded to. I hope in hindsight the circumstances behind this problem have been recognised and the solution is appropriate to it.

I do not have the time to do this until about 15+ hours time – meanwhile I would be grateful for any further or clearer instructions as to what to do. As ever, I am extremely appreciative of any help received.

To add, it would have been better if the op had continued in the original thread

Andrew have you ever contributed any correct information?
If your going to move the CMOS jumper it is not necessary to unplug the

system and remove the

battery.
Also a repair install works just fine with a new board.

1st unplug power,remove the battery,locate the CMOS
jumper pin on the

MB,

usually by the battery,move the pin from 1-2 position to 2-3
for .45

Re: Motherboard issues, continued

seconds or
so, then back to 1-2 position, replace battery, start pc. You'll
need to

enter

the
BIOS on start up, set date/time, load optimal defaults, then set
the BIOS
accordingly, save & exit. Also, a new board requires a new xp
installation, repair

wont

cut
it, set the BIOS to boot to xp cd (1st boot device), hd
2nd. Also, read the
owners
manual.....

I've hit further trouble.

I followed the instructions by removing all
the non-essential items, of
which there were few anyway. I then
removed the sound card from it's

PCI

slot. The repair function did not load, and
restarted automatically.

When

asked to boot from the CD, the Windows
setup also restarted itself.

The soundcard was then put back into the
computer. The same happened -

it

continues to restart continuously by itself,
without any intervention.

It seems the computer is in an irretrievable
loop of restarting - does

Re: Motherboard issues, continued

anyone have any suggestions? I am very
concerned at this latest

development.
