Good day everyone,

2 computers exist in the warehouse (win xp) connected to the main office through a 128K leased line to log on the DC (windows 2003).

Due to speed issues, I decided that the 2 users logon locally rather than to the Domain, however, the PC's are still part of the domain as they need to extract files sometimes from the domain controller.

A printer which is connected locally to one of those 2 computers was installed on the other one perfectly, when I did the change above, I'm not able to install the printer on the other machine through the network anymore.

any advice?

Was the printer a member of a domain local group? If so, you may need to change the settings there, perhaps by creating a new domain local group, putting the printer in it and assigning the ACL accordingly.
