I have Asus M2N8-VMX Motherboard. I have installed Windows XP Professional in my system. And I installed the chipset, audio, video ,lan etc drivers properly. And the device manager shows every devices are working properly. Physically there are no problems for video hardware, networking, audio hardware etc. I opened the volume control in windows. In the playback section I can adjust the volume levels of Master volume, SW synth, Line volume, CD Volume, Mic Volume etc properly. But In the recording section I can see all levels like Recording, CD Volume, Line Volume, Mic Volume, Stereo Mix etc. But in them only Recording volume level is active. I can adjust the level properly. But all the other levels like CD Volume, Line Volume, Mic Volume, stereo mix etc are disabled. But I can mute/unmute them. But please notice that I can play songs and record sounds very clearly and perfectly. but video editing softwares like Avid Express Pro are not working properly because of this problem. The software is automatically closing by showing an error message that "CAN NOT OPEN SOUND MIXER". At first i thought that this problem might be because of any windows file corruption. So i have formatted my hard drive and reinstalled windows xp. And i installed all the drivers properly. But the problem remains same. I have noticed this problem in many new Intel Desktop Boards with Reaktek High Definition Audio. Also I have noticed the same problem in new Asus, Msi motherboards also. But I noticed in one intel desktop 945 board (I don't remember the model number) there was no such problems with audio mixer. Then i tried installing the audio driver came with the support cd of that motherboard in my newly installed windows xp. But the problem remains same.

Audio Recording Control Issue In Realtek High Definition Audio

Now let me know the correct solution for this problem. I have also contacted AsusTek Customer care for the same problem with new Asus motherboard. But they were unable to find a solution for my problem. They instructed me to update audio drivers and provided some links. Also they instructed me to decrease audio hardware acceleration levels through Dxdiag. But the problem remains same. Later they said that they are forwarding my problem to senior technicians. But I have not received any replies yet.

Can anyone help me to find the correct patch
