I checked and I don't have access to any other hardware  
group that isn't  
dead.

Your question is very welcome here, except by one brain dead school kid  
who  
has never contributed anything useful. Do yourself a favour and killfile  
the little turd.

Dell Dimension 8200. Been  
a nice quiet computer for 6  
years. A few  
days  
ago, when I was out, I'm  
told fan that cools CPU  
decided to start

Re: Fan goes turbo the moment I turn on computer

blowing furiously. Then I'm  
told computer shut itself  
down.

I didn't find any thermal  
messages in system log.  
Computer boots and  
runs, but fan blows furiously  
the moment I push the  
power button to  
turn  
it on.

Ran Dell Diagnostics. It  
passed all tests. But there  
wasn't a test for  
the fan.

If it was a thermal problem,  
something getting hot,  
wouldn't it take  
at  
least a few seconds for  
something to get hot to  
trigger the fan? But  
this fan blows furiously the  
moment I turn on the  
computer.

Could it be a faulty  
temperature sensor  
somewhere? I wonder where  
the  
temperature sensor is. Is it  
built into the CPU itself?

What does this have to do with the OS?  
NOTHING. This is a purely  
hardware related question and is out of place  
in THIS group.

Ask elsewhere

And yet even YOU can't deny that this question has absolutely NOTHING  
to do with XP OS, which is what the group is about (see that word in  
the title?). So you back into your corner snarling and calling me  
names instead. THAT is the action of a juvenile. I don't pull my  
punches and, to use a common phrase, call a spade a spade. If you

Re: Fan goes turbo the moment I turn on computer

Re: Fan goes turbo the moment I turn on computer

would open your eyes and use your brain you would realize these posts I complain about are off topic but you choose to turn a blind eye to it. Go ahead, live in your own little world where you follow only the rules YOU decide are correct, and to hell with the rest of society.

I neither deny or affirm anything. According to the general usage and acceptance of the posts in this group, the only juvenile "living in his own little world" is you. No one else seems to have the slightest problem with the content of all the posts that you (and \*only\* you) seem to have unilaterally\* decided are unacceptable. You just can't get into that childish brain of yours that no one else gives a flying fuck what you think. The newsgroup name is microsoft.public.windowsexp.hardware. To the rest of the world that means that this is as good a place to post questions about hardware as any.

"Call a spade a spade". So you are a racist as well as a child.

\*You might have to borrow daddy's dictionary to look that one up. I doubt you will find it in "My first dictionary".

Oh, and the reply goes down [HERE](#), top poster. That's one more little polite rule of USENET netiquette you don't obey.

Look again – I didn't top post. My response was underneath the point to which it applied, exactly where it should be.
