all the time my monitor refresh goes worse then 75 or 85 hz. I'll see it begin to flicker barely or hurt my eyes then have to reset it. i will set it for 75 hz, it will be fine, then after a while, weeks or whatever have to set it for 85 hz cus it looses the 75 hz or something and hurts my eyes. literally there is a difference and it lost the 75 hz. the same thig happens for 85 hz and i have to reset it for 75 hz then it is fine again. then it will go bad again sometime and i change it to 85 hz, back and forth.

i've got an ati radeon 9700 pro also. and it doesn't matter what driver i use. re installing windows doesn't do anything since i have done that for other reasons and stuff a few times on this pc.

I have it set 1280x1024 .
