WinGuy, I went and deleted all the contents in the three Event viewer sections in My Computer and there are now no Red X's or Yellow Exclamation points left. I did still get that Error Loading again after shutting down and rebooting my system But there seems to be no problems at all logging into either IE or AOL and Yahoo. All three services work fine and no browser problems at all. I am wondering if that error has anything to do with McAfee Privacy Service that opens on my desktop on start up, that I have to log into before I can access anything on my system. A security measure that came with the McAfee Redzone suite. Thank's for all your advice, it thought me a lot believe it or not. If I ever find the reason I will post it here. But for now it looks as if I will have a resident in my system, be it a harmless one for now.

Aloha
