This weekend I dumped the illegal copy of XP pro I was running on my PC for a legal copy XP home and in the process lost my zip drive. I have 2 hard drives 30 gigs each (master/slave) and 2 cd's( master/slave, one writes) and the zip.

In the device manager "SCSI and RAID controllers" -> MASS storage controller, I have the yellow exclamation point and it states there are no drivers for this hardware. Whenever I try to reinstall or up date the driver it tells me that the signatures are out of date or Windows 95 drivers.

I've upgraded my bios and still nothing. Went over to Iomega but the only XP drivers they have are for the Parallel port models. Why did this work fine under XP Pro but not XP Home? Can I extract the driver from Pro?

When I tried to update the drive through Add New Hardware the following came up --

HPT 370 UDMA/ATA 100 Raid Controller

but wouldn't install it.

Any help would be greatly appreciated.

Thanks.

Yank
