I saw a similar post but my problem is slightly different. Everytime I insert a CD or try to access a CD in the drive (meaning autorun was turned on but then I turned it off to see if that was problem) Win locks up. If I take the CD out, my computer starts working fine again. This problem only showed up after installing a third hard drive on my system. I now have my C: and E: (two partitions on main drive) on Secondary Master. Another single partition drive on Secondary Slave. My CD-RW drive on Primary Master and my new third, single partitioned, drive on Primary Slave. If I take the third drive out everything is fine, no problems with the CD-RW drive at all. I have a BioSTAR M7NCDP (nforce2 ultra chipset) motherboard. I have XP Pro SP1. So is this possibly something wrong with Windows (note that when no disc in drive Windows recongizes drive just fine) or bad IDE addressing by the motherboard? Any help or suggestions greatly appreciated
