Long story.

I wanted to use 2 x 120 GB disks in a RAID mirror. Having set them up with XP PRO on one of them I discovered the MB chip would NOT support a mirror disk which included a working operating system without creating the system from scratch during the mirror creation.

I then decided I would accept a mirror system (logical partitions) without XP. However, since I didn't want to start from scratch I tried to copy XP to an 80GB physical hard disk (using PartitionMagic 8) which I intended to use for that purpose. This was unsuccessful and I tried another hard disk with like result.

Eventually I applied the XP setup disks to the 80GB disk and this was successful.

I have removed all the XP systems from physical disks, but on booting I am provide with 3 options i.e. XP, XP#1 and XP#2 although only XP works. My problem now is that although there is only one system present it is labelled "F" which is more than a nuisance.

XP PRO's Disk Management will not allow me to change the drive letter because it is the system drive.

How can I get the drive letter back to C: please?

PS

PM8 would seem to allow the change but I am afraid to invoke it. I have entered a change from F to C and the PM screen shows:

"Warning.

This partition contains the Windows directory. If you change this drive letter, your system might not boot.

Continue with drive letter change?

Yes/No"

Anyone any views please?
