Hello–

I have the following computer components:

AMD 2.8G celeron 32 bit  
ASUS p4p800Dx motherboard  
512M RAM

Harddrive – tried 2.

The problem:

Several days ago as I was working in Word my computer, which has been running mostly on with various reboots, for about 2 years now, suddenly gave me the BSOD. I reboot (didnt pay attention to what it said thinking it was a fluke), started up and worked fine for 10 minutes, then froze. Hit reset and computer would no longer boot. I came back 2 hours later and turned it on and it boot. Worked fine for a while, then froze. Same issue, wouldnt reboot after a reset.

Finally it wouldnt boot at all. After about 1 full day of playing around got a new p4p800 motherboard and at least I would get a bios screen now.

The current problem (After reloading XP onto another HD on another computer and un-checking 'reboot on failure' in the control panel, is the following  
BSOD:

A problem has been detected and Windows has been shut down to prevent damage to your computer.

If this is the first time you've seen this Stop error screen, restart your computer. If this screen appears again, follow

## XP BSOD reboots SP2

these steps:

Check for viruses on your computer. Remove any newly installed hard drives or hard drive controllers. Check your hard drive to make sure it is properly configured and terminated.

Run CHKDSK /F to check for hard drive corruption and then restart your computer.

Technical Information:

\*\*\* STOP 0x0000007B (0xF9E49528, 0xC0000034, 0x00000000, 0x00000000)

Other interesting info:

With XP SP2 reloaded onto new HD (maxtor), this new OS/HD combo works fine in another PC box (AMD celeron 2.4G, not sure the rest). If I put same disk in my 'bad' PC box, I get that BSOD above.

Ive swapped the video card, memory, power supply. There arent any other boards in 'bad' PC box to swap or change out. The only thing left is the CPU and it seems to get to 'safe mode' just fine. At this point Ive spent about 20 hours or so swapping stuff and going back and forth to Fry's electronics trying to figure out whats wrong.

Lastly, it would be \*awfully\* nice of XP NOT TO set the default behaviour to Reboot on failure so at least we had \*SOME\* information about what the problem was!!! Their answer appears to be, we had a problem, lets just reboot and it might clear itself up!

Thanks for any help,  
Jeff
