Apology here. Before I saw the previous note, I did not see the google reference which showed several items, one of which was a Microsoft item regarding the xxx in the file name. I thought the original question was letting the xxx represent 'any particular file name' and so erred in my answer. I didn't understand that the xxx was actually the file name. The files on my computer that I get the runtime error on are part of a program's tasking system which I apparently damaged myself by disabling an icon.
