Hi Dick,

Some sort of success. I can connect via Remote Desktop to both machines from each other. Zone Alarm prompted me to allow access to the program enabling me to identify it and then add it to Norton by prowling in remote control. Still can't shutdown the machine remotely though even with frewalls disabled. When I try and browse for computers when I use the shutdown -i interface I just get the message directory service is unavailable. When I use the shutdown -s -m \\lleucu I get access denied. When I try to put in the machine's ip address I get failed. I don't know if this helps to solve the problem.
