I try to explain more my experience: I have one file "secret.txt" in folder "c:\reserved\" and I've created a hard link with "fsutil hardlink create public.txt c:\reserved\secret.txt".

Ok if the date in secret.txt was "My name is Michael" the same data was in public.txt but after then if I try to edit secret.txt I can't but public.txt doesn't change.

That's why I asked you if you've tried, and if you can make the same proof. Thanks

Or create a hard link with Unix, No I haven't tried that. But other commands work so that one should too.

You understand NT (and XP is NT5.1) is an OS that runs other OSs. Internix/Posix, OS/2, and Windows are the three standard subsystems. Dos and Win 16 are run in a windows (not NT) program that emulates that environment.

The only standard NT program (known as a native mode program) I can think of is autocheck (the worker program that chkdsk uses). Nearly everything else is a windows program (as OS/2 is no longer included in 5.1 and Internix is now a download rather than installed by XP's setup).

Also people like Bill Gates are Unix experts and know more about Unix than Dos. MS ran their company on Unix, wrote Dos and Win 16 on Unix, wrote the Intel port of Unix, and Unix was MS's first OS they sold.
