Kind of worked, kind of didn't. It only applies the settings to the main F:, those files, direct subfolders, and their directories. Problem is, my hard drive has an extensive amount of folders, so its not applying the settings to ALL files. Also, the files have permissions, but nothing is actually checked for them. So the user is set, just not the "allow" statements themselves.

Yes, follow these instruction:

1. Download subinacl from Microsoft and install:

<http://www.microsoft.com/downloads/details.aspx?FamilyID=e8ba3e56-d8fe-4a91-93cf-ed6985e3927b&di>

2. Open Notepad and copy the following lines into notepad:

```
subinacl /subdirectories %SystemDrive% /grant=administrators=f
subinacl /subdirectories %SystemDrive% /grant=system=f
```

3. Save the Notepad file as "adminreset.cmd" and save to "C:\Program Files\Windows Resource Kits\Tools" folder.

4. Double-click the "adminreset.cmd" file that was saved in "C:\Program Files\Windows Resource Kits\Tools" folder.

Note: It /may/ take some time to complete the process after clicking the "adminreset.cmd" file

Re: Can't move files.

It worked, but only a little bit. I changed the entire drive to allow all permissions to my user, and the Administrators group, which for some reason it wasn't already. I checked, and it says it would apply the settings to all folders, subfolders, and files. Yet, it is still giving me permission denied errors on everything it was before. And every file within the drive still has the old permission sets. If you could find a way for everything to just be set to allow Administrators full permission to everything, that'll be fine. Hopefully you can help.

Here's the issue:
My computer has two hard drives, they are set as the C: and F:. Assume that I wanted to move something from one folder in the C: (C:\folder1) to another folder anywhere in the computer (F:\folder2), it would work fine. Though, if the original folder was on the F:, and it was moved to a separate folder on the F: (F:\folder1) to (F:\folder2), it wouldn't exactly fail, but everything

Re: Can't move files.

is messed up. All files, unless they are in a subfolder, would be read as 0 bytes, and give me a permission denied error when trying to open them. If it is a folder, it would give a permission denied error when trying to open it, thus making all the subfolders and sub-files impossible to get to. And as a side note, everything is fine when moving between the C: and C:, but only messes up on F: to F:. Also, if I copy the files and not move them, it also works fine.

Hope somebody can help, and thanks in advance.
