This is more likely a hardware problem than a Windows problem.
Some diagnostics need to be run to determine which component is the problem.

When I first start my pc I get the following lead in:

Phoenix-Award workstation BIOS V6. OOPG
Main Processor: etc.
Memory Testing: etc.
Primary master: etc.
Primary Slave: etc.
Secondary Master: etc.
Secondary Slave: etc.

And then it freezes there and I have to turn off the pc and restart
anywhere
from 4 to 6 times before it will move on to the "Welcome to Windows
XP".
Has anyone out there had this problem and if so how was it corrected.
Thank
you for any help.
