I made this comp my self, Asus mobo, amd 3700 processor . but uhh funny thing is that it worked fine b4 i tried to install windows vista... >: ( but anyways i had all the hdds set up and they boot config was on the main drive i set up i think it was delted. but other than that ill try what you say. u cannot reformat it to i got to much data on this that it wouldnt be too good so im gona try to repair it. my buddy has the same ver of media center as me i think im just gona copy his windows folder and overwrite mine because we basicly have the same set up so i dnt see a prob.

the bois sems em all fine and there all set as slave \* i hvnt seen any need to set one to master\* i just c windows media center dsnt have the repair install. :(

sounds pretty complicated.

i think that if you get something stabilized on your pc, you'll be happier. I suggest the following to bring you up and running. Afterwards, I think you can handle the rest.

First disconnect everything from your pc except for keyboard, mouse and video.

Secondly, get inside your pc and see if you have any special boards installed like usb, video etc. If so, remove them temporarily.

Thirdly, while inside your pc check your harddrive configurations. If you have a slave drive, then the jumpers on the back must be set in slave set. Some people try to connect a slave drive as the master and creates conflict.

Re: Winows BSOD after the The Scrowling windows bar winxpmediacent

Be sure that the master drive jumpers are configured as master as well.

Since you have a couple of harddrives you need to decide which one will be the main one. Then only connect that drive for right now to the ribbon cable. I suggest that you temporarily use only one harddrive at this time so that you can get a functional o.s. running. Later, you can connect the other equipment.

When you boot, get into your cmos/bios and make sure that harddrive is being recognized. Afterwards see if you can boot normally to the o.s.

If not, then reboot with the cd and do a repair install. Afterwards see if you can boot normally to the o.s.

If not, then reboot with the cd and do a clean install. Afterwards see if you can boot normally to the o.s.

If not, then you may go back inside and hook up the other harddrive as the master. Remember to use only one hd at this time.

Then start over with the steps near the beginning that we used for the other hd.

Let us know what are your results...

Ok Im not to happy at the moment... randomly now windows xp mediacenter will not start up for any apparent reason i think the registry is currupted. I did that thing in the repair area were u kinda redo the reg that DID work because it just forze up after the 2nd bar now it goes though that but its just BSOD no sounds nothing. >: ( THIS is the second install of this on a diff hdd the first install is down here diff hdd

Re: Winows BSOD after the The Scrowling windows bar winxpmediacent

Personaly im not happy w/ windows because I was parnoid about havn no workn OS's so i bought windows media center and put it on my other hdd and when i tryed installed Vista it said tthere was an error and currupted 75% of all my data on all my hdds to me arround a month to fix the non windows part but now both my OS's are currupt.. so i got a old hdd and put media center on that cuz i can still access all the datta off it... now that 1 is currupt.

And then on my other comp.... yeah... illl talk about this later when i get this fixed because its thoughn out the wiredest error i secrously thing windows kinda imploded on it self there.

But my main concern is The first paragraph.  
then the second after i get the first 1 up and .

Oh and in the second the master boot records are gone so it dsnt know it has a OS on it ether.... lol i think everything else is there becaus it just had a curruppted OS registry b4
