I appreciate the suggestions, guys, but those aren't exactly my question.

I've checked System Restore. That is being factored into the 24.0 Gigs I found at the end of the original post, because I gave myself access to the System Volume Information. I've cleared out TIFs as well. My Recycle Bin is 464 MB currently, which is also factoring into the 24.0 GB.

Ken: Disc Management is consistent with the C: Properties dialog box, ~30 GB.

Shenan: I use WinDirStat, whose results I mentioned in the original post. It's essentially the same as SequoiaView.

I'm just trying to figure out if there's any reason for the (now 5 gig) inconsistency between the Properties of the hard drive and file size of all files. Yes, all hidden files and system folders are being show.

Single user computer?

(In other words – do you have full access to all files?)

I have a discrepancy of 2.1GB myself.

Usually its less when I clear out the TIF files, use disk cleanup, use CCleaner, etc..
