Okay, I am getting a little desperate here. Over the past few months I have noticed that my CPU was going to 100% and that the taskbar was becoming unresponsive. Other events were being processed from time to time, but very slowly. I traced the offending executable to svchost.exe. I found a long list of services running under this instance of svchost. I took note of the time that it started and waiting. Exactly 10 minutes later, the computer became responsive again and I could resume activity. I looked at the event log and saw the following message (below.)

Searches yielded the following article:<http://support.microsoft.com/kb/289653>

I searched my drive and I do not have the vbs specified in the article to examine the logs. It seems they have repurposed something from SharePoint to do the indexing. I am not sure if this Windows Search Service is part of the core OS or if this was installed as part of Microsoft OneNote. I set the service to start Manually but it seems to start on its own, presumably as part of some dependency tree it is needed by other services that start it.

Anyway, I am at a loss as to how to diagnose this problem. I am actually a SharePoint developer but I have never installed SharePoint on my personal home machine. If no one has any ideas I am going to have to find this vbs file and see what I can see.

Re: Windows Search Service svchost.exe lockup 10 minutes

Cheers,
Rob

Event Type: Warning
Event Source: Windows Search Service
Event Category: Gatherer
Event ID: 3035
Date: 5/9/2007
Time: 7:56:04 PM
User: N/A
Computer: INLET

Description:

One or more warnings or errors were logged to file <C:\Documents and Settings\All Users\Application Data\Microsoft\Search\Data\Applications\Windows\GatherLogs\SystemIndex\SystemIndex.337.gthr>. If you are interested in these messages, look at the file using the gatherer log query object (gthrlog.vbs on the log viewer Web page).

Context: Windows Application, SystemIndex Catalog
