Seems like it would recover using system restore if it were the updates.

I had the same thing happen to me and I think it was cuz I got all the microsoft updates...I only got a few on my fresh install and it works fine,  
but anything after SP2 just screws with my system for some reason. I have a legal copy so thats not the problem. Dunno if this helps any but maybe someone can tell us why it does that?

Check the temperature of the CPU. It should not be too hot to touch. The fan may have failed.

Last night I tried to boot up and kept being taken to the screen that says Windows had a shut down problem, then it has a list of options to choose

Re: Windows XP wouldn't boot up

from, normal boot, safe mode, etc. I have tried all the options  
and  
all my  
computer ever does is a constant reboot. I finally was able to  
"break  
in"  
and do a system restore. After the restore, the computer did  
the same  
thing.

Does anyone have any ideas? I run E-trust software for  
viruses,  
firewall  
and spyware.
