Hi,

In our domain, we are connected around 100 PCs. except for a user (myadmin), we have given all other users as domain users power only.

However if any user require admin rights for their PCs we give admin rights to their user name in that pc through the myadmin user only.

Since some of the users are changing their pcs frequently whenever they ask admin rights to their PCs we are going to their location and giving admin rights. We couldn't able to connect their pcs remotely through Dameware Remote control since their user id is not even in power user group in that local machine since their are logging to that pc with their ID for the first time.

I don't personally think you should be giving out admin, even local admin, like this in the first place but still...

As I understand your post

- * anyone who wants can be an admin
- * they don't always use the same machines, they move around a lot

I'm going to propose a different solution based on that – you create a group in your domain, and this group is added to each workstation's local administrators group as part of your default build / group policies.

You can then add and remove people from this group on the domain quite easily, granting them local admin rights on any and all machines without any
