Hi Kevin,

Not completely understanding you.
Not long in, but it is login into Comcast.

Is Comcast, your ramp onto the Super Highway (Internet) or is Hughesnet?
What is Hughesnet?

What version of Windows Messenger is installed?

Antivirus is and was up to date and runs a full scan every night on both computers. One computer is connected directly to the Hughesnet hardware via usb and has a nic connected to a Lan. On the lan is another computer that uses Internet Connection Sharing to access the internet. I am experiancing some issues on the computer connected directly to the Hughesnet like I can go to www.hotmail.com but I can't long in. I can go to Comcast and long into my webmail. I have tried to long on to MS Messenger to establish a remote control session but Messenger times out. When I run the troubleshooting wizard it tells me there is something wrong with the gateway. I contacted Hugesnet and was assured that the gateway was configured properly because I

Re: Slow Internet Connection Sharing

could get to other internet sites.

Hi Kevin,

Did you run an anti-virus scan? You have not mentioned any Router being used. Do you have a Router and have you reset the Router and restored its settings?

I have been dealing with a few problems with a very slow computers and Hughesnet. I have two computers in a location that does not have any other option than Hughesnet Satellite for "high speed" internet. The computer that is connected to Hughesnet's equipment is slow accessing and using the internet but it is useable. The second computer accesses the internet via Microsoft's internet connection sharing. Under most circumstances the second computer is so slow that it almost unseable. I have contacted hugesnet and all I get for support is that they check the speed on the computer connected to their equipment and determine that they get a certain amount of signal and have determined that it is working properly. As a last resort we tried

Re: Slow Internet Connection Sharing

to
Reset Internet Explorer Setting. The computer now will not
access the
internet at all. When you launch IE7 it tries to get to
Microsoft's
IE7
set
up site but the computer is so slow that it times out and will
not let
me
change the home page on anything else until it runs the one
time set
up.
