Hi All (Machine specs below my sig)

I got a bsod OXOOOOOOOA. (soft or hardware related) Anyhow event viewer recommended checking C:\ for disk errors, which I did. But no joy, also with xp disc. So I did last known good configuration at boot. And upon booting and getting to welcome screen, a message stating;
"lsass.exe - system error - object name not found"
I read it could be a sasser worm and also maybe not. Also it does the same in safe mode. Now to the point.

I DL Ultimate boot CD, which allows you to enter DOS with command prompt, to which I copied "lsass.exe" onto floppy from another machine winxp home sp2 whereas my faulty machine is winxp pro sp2 (hopefully they are the same, I believe the "lsass" file has something to do with user logon!!)

And after the command prompt A:\ I added "copy lsass.exe C:\windows\system32" even tried "move" instead of "copy" but to no avail. This was in the hope that if that file was just corrupted, I could replace it from floppy, boot up and do an intensive virus scan and hope fully the bsod would go away also. I even DL sasser removal tool on floppy but I get the same trouble trying to run that.

Does anyone have any experience using "ultimate boot cd"? That could give me the path and instruction to run or replace a file?

I'd rather not reformat as some have and the same thing has happened.
Done a memtest
HDD diagnostics
Ram tests also and up to now they seem alright.

"3 solid days of hassle" :-((
