Well I'm still using build 0322 and I'm getting fed up with the fact that it uses about 50MB of RAM to run, and with a message window open it's definitely using up to 85% of CPU or more. But I heard the 0324 build was suppose to fix that?

Same problem here. MSN Messenger takes constantly 90-100% CPU usage.  
Windows Messenger 70% CPU usage.

Any ideas ?

regards Martin

Since installing MSN Messenger 7.5 Build 7.5.0324 I have had a couple of problems firstly it completely crashed on wininet.dll 6.0.2900.2861 and Outlook and Explorer also crashed so I downloaded debug version of the WININET.DLL 6.0.2900.2180 which solved the crashes but now MSN frequently takes up 90% to 100% cpu in Windows Task Manager in Processes which makes all other tasks grind to a halt so I have to end the process of msnmsgr.exe to continue working. I have done a search and it seems that lots of users are experiencing problems with cpu usage in 7.5 So maybe the boffins at Microsoft can get their respective thinking caps on a solve the problem.

Regards Dave.
