Hi – and thanks for reading this.

I am running Windows XP SP2 and MM 2.1. I have just got a Canon MVX460 and when I transfer the video into MM I am getting little pixel boxes flash up on the screen every few seconds. It shows on the import and also on the video when I play it back from MM – but it's fine on the camera. I also get little 'sizzles' on the audio. The video itself looks fine in MM – apart from the problems mentioned. It's not distorted or poor quality but I don't know why I'm having the problems.

My machine is an Athlon AMD 2400+ with a gig of RAM.

I have already been advised not to use the C drive and to make sure that nothing else is running, but the result is the same.

Thanks for any help.
