I have an issue with my network at home. I have a laptop running WindowsXP Pro, which is setup to log onto my work domain called FUTURE. At home, I have a desktop running WindowsXP Home. I would like to be able to setup my home network so I can log on to the FUTURE domain through a VPN and print to the desktop's printer. But I haven't been able to figure out how to do this.

I don't think I can change the network settings on the laptop, or it will prevent me from logging onto the FUTURE domain. I can setup the desktop however is required. I tried setting the desktop's workgroup as FUTURE. When I did this, the laptop could see the desktop listed under the FUTURE domain. However, the laptop could not access anything on the desktop. I did have the desktop setup for file and printer sharing, but was denied access. Meanwhile, the desktop received an error that it could not be authenticated on the FUTURE domain, and it could not see any computers on the domain.

Any ideas?
