Hi all, and hopefully thanks in advance.

A lot of our employed are travelling all around the world the common way to access our company network was to establish an ssh connection with an tunnel for an terminal server system. We have a new installed windows 2003 terminal server, previous times we used citrix terminal software. Now we want to replace citrix by accessing the windows 2003 terminal sever. Every thing so far works fine excepts when accessing with windows xp.

We are tunnelling the port 3389 for RDP from the server to the localhost. A web search told us that we need to move the files mstsc.exe and mstscax.dll in a separate sub directory and to run the mstsc.exe in compatibility (either 95 or 98) mode (strange behaviour).

After doing this we can establish the remote connection ones (per new client installation), every further times we get an error stating that there was a licence protocol error and that we should try to reconnect or to ask our admin (but also they don't have any further idea).

Hallo Microsoft, that is your product, is there any solution running xp on the client.

Does anyone else found the same problems maybe with a solution..? We would be very grateful because our employees are not very happy with the current situation.

Regards

Erik
