Running NIS & NAV. Initially disabled NIS and turned of XP Firewall (never normally use it anyway). Yesterday removed NIS and NAV completely from client, but still the same result. It's really weird, can do everything but connect to the Net. The client is my son's PC, as far as I know, no major changes have been made since it worked, possibly any XP updates as it is on Autoupdate, I guess I could be radical and system restore back to when it worked, I would still like to know what caused it for curiosity if nothing else
